

"Hearken unto this, O Job: stand still, and consider the wondrous works of God" (Job 37:14). One way we learn of God is by His wondrous works. Every creature shows forth the praises of the Creator, the Master-Designer. The dragonfly undergoes a metamorphosis as stupendous as the butterfly. After hatching from an egg, the dragonfly nymph or grub (larvae) lives near the mud in a pond or lake where it becomes a ferocious hunter, devouring insects, fish, tadpoles, plants and even its own siblings! It looks like a weird alien and lives in this watery world for about two years. It then crawls out of the water onto a reed and transforms into the most remarkable flying machine! It is the fastest flying insect (35 mph), having beautiful transparent wings. The four wings move independently of each other enabling this creature to go up and down, zip to the left, then to the right, do figure 8s, 360s, fly upside down and even fly motionless in one spot. It is the amazing acrobat of the sky, and no one had to give it flying lessons. His head is made up mostly of his remarkable big eyes which can see in every direction except backwards. He catches his prey in flight. After mating and laying eggs, its short life as an adult lasts only about two months. Some of his ancestors had a two-foot wingspan as indicated by some fossils probably formed during Noah's flood.

Dragonflies picture our so-great salvation. We once groveled in the mud and filth of this world, carrying out our wicked deeds. Then the grace of God reached us, saved us, transformed us into the realm of the heavenlies (*Eph. 2:5-10*). "I will speak of the glorious honour of Thy majesty, and of Thy wondrous works" (*Psalm 145:5*).
